designed for undergraduate and postgraduate students of mathematics the book can also be used by those preparing for various competitive examinations the text starts with a brief introduction to results from set theory and number theory it then goes on to cover groups rings fields and linear algebra the topics under groups include subgroups finitely generated abelian groups group actions solvable and nilpotent groups the course in ring theory covers ideals embedding of rings euclidean domains pids ufds polynomial rings noetherian artinian rings topics of field include algebraic extensions splitting fields normal extensions separable extensions algebraically closed fields galois extensions and construction by ruler and compass the portion on linear algebra deals with vector spaces linear transformations eigen spaces diagonalizable operators inner product spaces dual spaces operators on inner product spaces etc the theory has been strongly supported by numerous examples and worked out problems there is also plenty of scope for the readers to try and solve problems on their own new in this edition a full section on operators in inner product spaces complete survey of finite groups of order up to 15 and wedderburn theorem on finite division rings addition of around one hundred new worked out problems and examples alternate and simpler proofs of some results a new section on quick recall of various useful results at the end of the book to facilitate the reader to get instant answers to tricky questions

designed for undergraduate and postgraduate students of mathematics the book can also be used by those preparing for various competitive examinations the text starts with a brief introduction to results from set theory and number theory it then goes on to cover groups rings vector spaces linear algebra and fields the topics under groups include subgroups permutation groups finite abelian groups sylow theorems direct products group actions solvable and nilpotent groups the course in ring theory covers ideals embedding of rings euclidean domains pids ufds polynomial rings irreducibility criteria noetherian rings the section on vector spaces deals with linear transformations inner product spaces dual spaces eigen spaces diagonalizable operators etc under fields algebraic extensions splitting fields normal and separable extensions

algebraically closed fields galois extensions and construction by ruler and compass are discussed the theory has been strongly supported by numerous examples and worked out problems there is also plenty of scope for the readers to try and solve problems on their own new in this edition learning objectives and summary with each chapter a large number of additional worked out problems and examples alternate proofs of some theorems and lemmas reshuffling rewriting of certain portions to make them more reader friendly

group theory a modern introduction with examples and applications looking for a reliable and structured algebra book that builds clarity from fundamentals to advanced concepts this comprehensive algebra guide is designed for undergraduate and postgraduate mathematics students who seek conceptual depth logical clarity and strong problem solving skills developed with academic precision and inspired by leading algebra scholars the book brings together theory structured explanations and carefully selected examples to strengthen mathematical understanding built upon years of teaching experience and classroom interaction this book addresses common conceptual challenges faced by students and provides systematic solutions to master algebra with confidence with clear explanations reference supported content and academic rigor this book serves as a dependable resource for higher education and exam preparation a thoughtfully crafted academic companion for serious learners of mathematics

topology is a branch of mathematics that studies the properties of spaces that are preserved under continuous deformations such as stretching or bending but not tearing or gluing it focuses on concepts like continuity open and closed sets compactness and connectedness without relying on exact measurements like distance or angles a key idea is the topological space a set with a structure that defines which subsets are open two spaces are considered topologically equivalent homeomorphic if they can be transformed into each other through continuous functions with continuous inverses topology has various branches including point set topology algebraic topology and differential topology and it plays a foundational role in fields like geometry analysis and theoretical physics starts with point set topology basic definitions open closed sets interior closure boundary etc pearsoned co in moves on to continuous functions and homeomorphisms

metric spaces pearsoned co in key topological properties connectedness compactness pearsoned co in advanced topics applications knots robotics graphs manifolds embeddings fixed point theorems homotopy theory degree theory pearsoned co in also includes topics like dynamical systems and chaos
